

GUIDE v.36.0 0.50-SE classification tree for predicting **USAScore** using bivariate nearest-neighbor node models, equal priors and unit misclassification costs. Tree constructed with 2253 observations (excluding observations with non-positive weight or missing values in D, T, R or Z variables) has no splits. Maximum number of split levels is 12 and minimum node sample size is 22. Best split variable is **Race**.
