

GUIDE v.36.0 0.50-SE classification tree for predicting USAScore using equal priors and unit misclassification costs. Tree constructed with 2253 observations (excluding observations with non-positive weight or missing values in D, T, R or Z variables). Maximum number of split levels is 12 and minimum node sample size is 22. At each split, an observation goes to the left branch if and only if the condition is satisfied. Set  $S_1 = \{\text{Asian, NA}\}$ . Intermediate nodes with splits due to interaction are in wheat color. Predicted classes and sample sizes printed below terminal nodes; class sample proportions for USAScore = COVID, No\_Bias, and Non\_COVID, respectively, beside nodes. Second best split variable at root node is Race.
